User Story 2
"As a user, I want my recommendations to show in order of best matching games so that I can easily pick the games that I would most likely enjoy the most, based on my recently played on Steam."

When the app works:
- User logs in successfully
- User can authenticate their google account
- See user story 1
- User views a list of recommended games in order of most matching all the way down
- Using the API, we will display a list of good matches in a list with best matching games and subsequent matches following after
- Variables such as high metacritic scores and genre matches will be taken into consideration when displaying the games

Satisfaction criteria
- The games are actually good recommendations
- The best match is shown at the top of the list
- Generally good matches are shown sequentially down the list

Unsatisfactory criteria
- User cannot log in successfully
- See user story 1
- Recommendations show games that are not good matches
- Games are not in any kind of order
- May be messy for user

This is important because we want the users to be able to easily find the best matches based on their interest in games.
